

Disease prevention

Together we can do it!

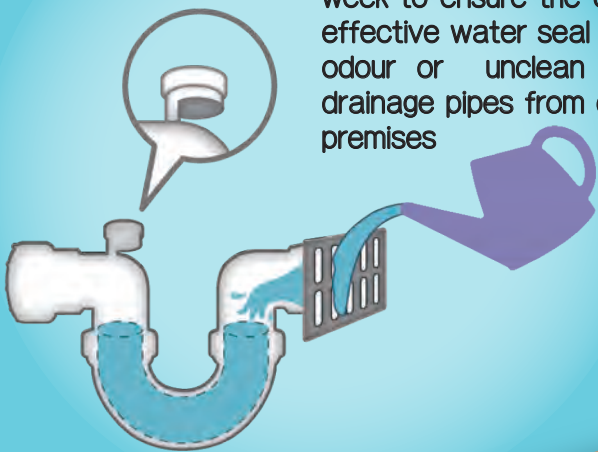

“Let's fight the pandemic together to prevent unclean transmission through drainage and ventilation”

LEAKY DRAIN BUSTERS
渠漏
解決師

Install U-trap with anti-syphonage air valve

Pour at least half a litre of water into each floor drain outlet every week to ensure the U-traps contain effective water seal to prevent foul odour or unclean substances in drainage pipes from drifting into the premises

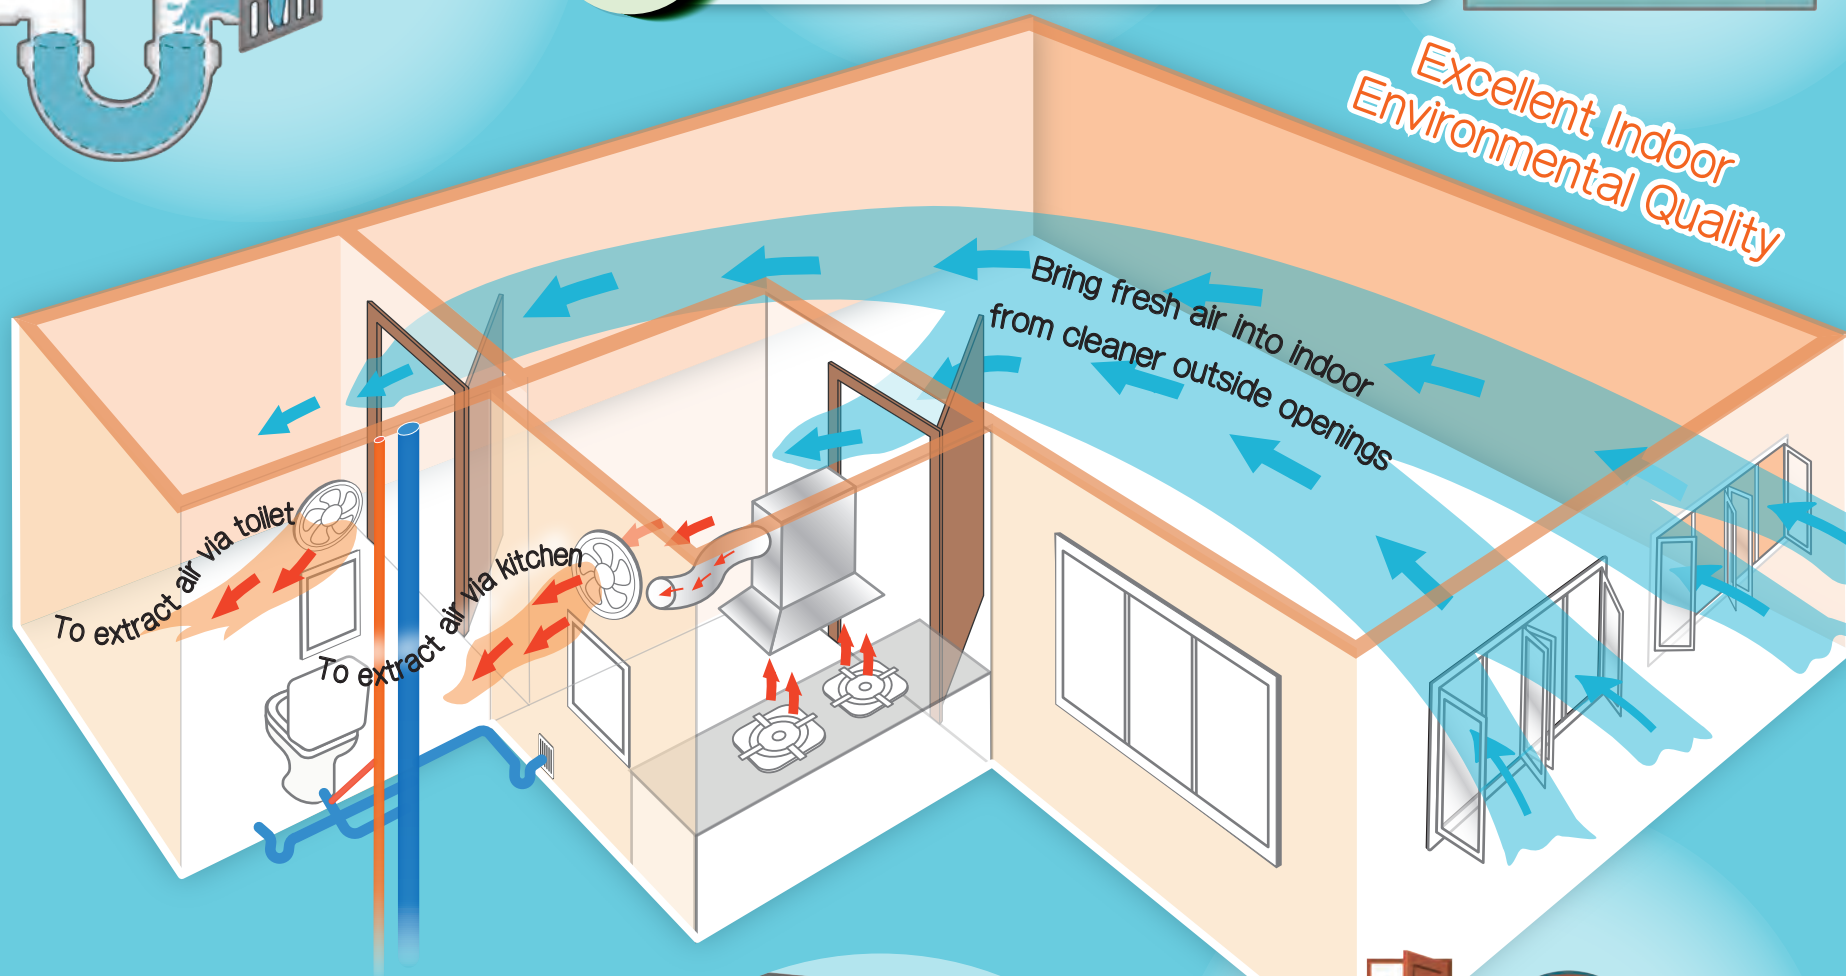

Inspect and ensure soil pipe is properly connected to anti-syphonage pipe
Disconnection of anti-syphonage pipe is not proper and can lead to spreading of unclean substances

Open window with less outside obstruction to bring in more fresh and cleaner air to promote good ventilation

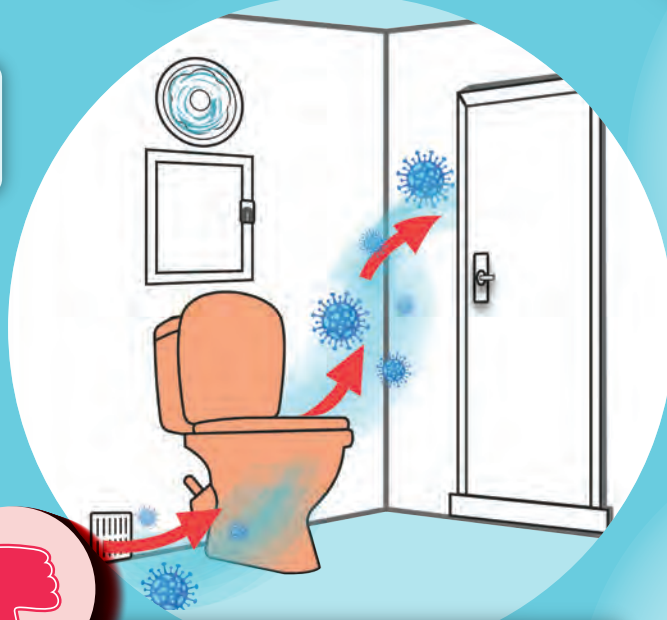

Excellent Indoor Environmental Quality

Unclean substances / odour can enter into premises through pipe leaks

If toilet has not been used for long time or occupants forget to pour water into the floor drain regularly, the water seal in the trap can evaporate gradually and lose its capability to prevent foul odour or unclean substances from entering the premises

Maintain Better Ventilation in Toilet and Kitchen Area

Kitchen: allow the kitchen's door slightly open
Toilet: Install door louvre, or allow door slightly open or provide reasonable gap at the bottom of door

Keep windows at lightwell shut to preclude ingress of polluted air

Enhance the ventilation by exhaust air fan
